- Handling & Assembly Instructions**
- Switching inductive and/or capacitive loads create voltage and/or current peaks, which may damage the relay. Protective circuits need to be used.
  - External magnetic fields need to be taken into consideration, including a too high packing density. This may influence the relays' electrical characteristics.
  - Mechanical shock impacts e.g. dropping the relays may cause immediate or post-installation failure.
  - Wave soldering: maximum 260°/5 seconds.
  - Reflow soldering: Recommendations given by the soldering paste manufacturer need to be considered as well as the temperature limits of other components/processes.
