

## REF20xx Low-Drift, Low-Power, Dual-Output, $V_{REF}$ and $V_{REF} / 2$ Voltage References

### 1 Features

- Two Outputs,  $V_{REF}$  and  $V_{REF} / 2$ , for Convenient Use in Single-Supply Systems
- Excellent Temperature Drift Performance:
  - 8 ppm/°C (max) from –40°C to 125°C
- High Initial Accuracy:  $\pm 0.05\%$  (max)
- $V_{REF}$  and  $V_{BIAS}$  Tracking over Temperature:
  - 6 ppm/°C (max) from –40°C to 85°C
  - 7 ppm/°C (max) from –40°C to 125°C
- Microsize Package: SOT23-5
- Low Dropout Voltage: 10 mV
- High Output Current:  $\pm 20$  mA
- Low Quiescent Current: 360  $\mu$ A
- Line Regulation: 3 ppm/V
- Load Regulation: 8 ppm/mA
- Matte-Sn version (REF2025AISDDCR) for improved corrosion resistance in the Battelle Class III and similar harsh environments

### 2 Applications

- Digital Signal Processing:
  - Power Inverters
  - Motor Controls
- Current Sensing
- Industrial Process Controls
- Medical Equipment
- Data Acquisition Systems
- Single-Supply Systems

### 3 Description

Applications with only a positive supply voltage often require additional stable voltage in the middle of the analog-to-digital converter (ADC) input range to bias input bipolar signals. The REF20xx provides a reference voltage ( $V_{REF}$ ) for the ADC and a second highly-accurate voltage ( $V_{BIAS}$ ) that can be used to bias the input bipolar signals.

The REF20xx offers excellent temperature drift (8 ppm/°C, max) and initial accuracy (0.05%) on both the  $V_{REF}$  and  $V_{BIAS}$  outputs while operating at a quiescent current less than 430  $\mu$ A. In addition, the  $V_{REF}$  and  $V_{BIAS}$  outputs track each other with a precision of 6 ppm/°C (max) across the temperature range of –40°C to 85°C. All these features increase the precision of the signal chain and decrease board space, while reducing the cost of the system as compared to a discrete solution. Extremely low dropout voltage of only 10 mV allows operation from very low input voltages, which can be very useful in battery-operated systems.

Both the  $V_{REF}$  and  $V_{BIAS}$  voltages have the same excellent specifications and can sink and source current equally well. Very good long-term stability and low noise levels make these devices ideally-suited for high-precision industrial applications.

#### Device Information<sup>(1)</sup>

PART NAME	PACKAGE	BODY SIZE (NOM)
REF20xx	SOT (5)	2.90 mm x 1.60 mm

(1) For all available packages, see the orderable addendum at the end of the datasheet.

#### Application Example

#### $V_{REF}$ and $V_{BIAS}$ vs Temperature

## 4 Revision History

NOTE: Page numbers for previous revisions may differ from page numbers in the current version.

Changes from Revision C (January 2017) to Revision D	Page
• Changed application information to include corrosion resistance advantages. ....	18
Changes from Revision B (July 2014) to Revision C	Page
• Added I/O column to <i>Pin Functions</i> table .....	3
• Added <i>Storage temperature</i> parameter to <i>Absolute Maximum Ratings</i> table (moved from <i>ESD Ratings</i> table).....	4
• Changed <i>ESD Rating</i> table: changed title, updated table format .....	4
Changes from Revision A (June 2014) to Revision B	Page
• Changed device status to Production Data from Mixed Status .....	1
• Deleted footnote 2 from Device Information table .....	1
• Deleted footnote from Device Comparison Table .....	3
• Added Thermal Information table .....	4
Changes from Original (May 2014) to Revision A	Page
• Made changes to product preview data sheet.....	1

## 5 Device Comparison Table

PRODUCT	$V_{REF}$	$V_{BIAS}$
REF2025	2.5 V	1.25 V
REF2030	3.0 V	1.5 V
REF2033	3.3 V	1.65 V
REF2041	4.096 V	2.048 V

## 6 Pin Configuration and Functions

### Pin Functions

PIN		I/O	DESCRIPTION
NO.	NAME		
1	$V_{BIAS}$	Output	Bias voltage output ( $V_{REF} / 2$ )
2	GND	—	Ground
3	EN	Input	Enable ( $EN \geq V_{IN} - 0.7\text{ V}$ , device enabled)
4	$V_{IN}$	Input	Input supply voltage
5	$V_{REF}$	Output	Reference voltage output ( $V_{REF}$ )

## 7 Specifications

### 7.1 Absolute Maximum Ratings

over operating free-air temperature range (unless otherwise noted)<sup>(1)</sup>

		MIN	MAX	UNIT
Input voltage	V <sub>IN</sub>	-0.3	6	V
	EN	-0.3	V <sub>IN</sub> + 0.3	
Temperature	Operating	-55	150	°C
	Junction, T <sub>j</sub>		150	
	Storage, T <sub>stg</sub>	-65	170	

(1) Stresses beyond those listed under *Absolute Maximum Ratings* may cause permanent damage to the device. These are stress ratings only, which do not imply functional operation of the device at these or any other conditions beyond those indicated under *Recommended Operating Conditions*. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.

### 7.2 ESD Ratings

		VALUE	UNIT
V <sub>(ESD)</sub> Electrostatic discharge	Human-body model (HBM), per ANSI/ESDA/JEDEC JS-001 <sup>(1)</sup>	±4000	V
	Charged-device model (CDM), per JEDEC specification JESD22-C101 <sup>(2)</sup>	±1500	

(1) JEDEC document JEP155 states that 500-V HBM allows safe manufacturing with a standard ESD control process.

(2) JEDEC document JEP157 states that 250-V CDM allows safe manufacturing with a standard ESD control process.

### 7.3 Recommended Operating Conditions

over operating free-air temperature range (unless otherwise noted)

		MIN	NOM	MAX	UNIT
V <sub>IN</sub>	Supply input voltage range (I <sub>L</sub> = 0 mA, T <sub>A</sub> = 25°C)	V <sub>REF</sub> + 0.02 <sup>(1)</sup>		5.5	V

(1) See [Figure 28](#) in [Typical Characteristics](#) for minimum input voltage at different load currents and temperature

### 7.4 Thermal Information

THERMAL METRIC <sup>(1)</sup>		REF20xx	UNIT
		DDC (SOT23)	
		5 PINS	
R <sub>θJA</sub>	Junction-to-ambient thermal resistance	193.6	°C/W
R <sub>θJC(top)</sub>	Junction-to-case (top) thermal resistance	40.2	°C/W
R <sub>θJB</sub>	Junction-to-board thermal resistance	34.5	°C/W
ψ <sub>JT</sub>	Junction-to-top characterization parameter	0.9	°C/W
ψ <sub>JB</sub>	Junction-to-board characterization parameter	34.3	°C/W
R <sub>θJC(bot)</sub>	Junction-to-case (bottom) thermal resistance	N/A	°C/W

(1) For more information about traditional and new thermal metrics, see the [Semiconductor and IC Package Thermal Metrics](#) application report.

## 7.5 Electrical Characteristics

At  $T_A = 25^\circ\text{C}$ ,  $I_L = 0\text{ mA}$ , and  $V_{IN} = 5\text{ V}$ , unless otherwise noted. Both  $V_{REF}$  and  $V_{BIAS}$  have the same specifications.

PARAMETER		TEST CONDITIONS	MIN	TYP	MAX	UNIT
<b>ACCURACY AND DRIFT</b>						
Output voltage accuracy			-0.05%		0.05%	
Output voltage temperature coefficient <sup>(1)</sup>		$-40^\circ\text{C} \leq T_A \leq 125^\circ\text{C}$		$\pm 3$	$\pm 8$	ppm/ $^\circ\text{C}$
$V_{REF}$ and $V_{BIAS}$ tracking over temperature <sup>(2)</sup>		$-40^\circ\text{C} \leq T_A \leq 85^\circ\text{C}$		$\pm 1.5$	$\pm 6$	ppm/ $^\circ\text{C}$
		$-40^\circ\text{C} \leq T_A \leq 125^\circ\text{C}$		$\pm 2$	$\pm 7$	
<b>LINE AND LOAD REGULATION</b>						
$\Delta V_{O(\Delta V_I)}$	Line regulation	$V_{REF} + 0.02\text{ V} \leq V_{IN} \leq 5.5\text{ V}$		3	35	ppm/V
$\Delta V_{O(\Delta I_L)}$	Load regulation	Sourcing $0\text{ mA} \leq I_L \leq 20\text{ mA}$ , $V_{REF} + 0.6\text{ V} \leq V_{IN} \leq 5.5\text{ V}$		8	20	ppm/mA
		Sinking $0\text{ mA} \leq I_L \leq -20\text{ mA}$ , $V_{REF} + 0.02\text{ V} \leq V_{IN} \leq 5.5\text{ V}$		8	20	
<b>POWER SUPPLY</b>						
$I_{CC}$	Supply current	Active mode $-40^\circ\text{C} \leq T_A \leq 125^\circ\text{C}$		360	430	$\mu\text{A}$
					460	
Shutdown mode $-40^\circ\text{C} \leq T_A \leq 125^\circ\text{C}$		3.3	5			
			9			
Enable voltage		Device in shutdown mode ( $EN = 0$ )	0		0.7	V
		Device in active mode ( $EN = 1$ )	$V_{IN} - 0.7$		$V_{IN}$	
Dropout voltage		$I_L = 20\text{ mA}$		10	20	mV
$I_{SC}$	Short-circuit current			50		mA
$t_{on}$	Turn-on time	0.1% settling, $C_L = 1\text{ }\mu\text{F}$		500		$\mu\text{s}$
<b>NOISE</b>						
Low-frequency noise <sup>(3)</sup>		$0.1\text{ Hz} \leq f \leq 10\text{ Hz}$		12		ppm <sub>PP</sub>
Output voltage noise density		$f = 100\text{ Hz}$		0.25		ppm/ $\sqrt{\text{Hz}}$
<b>CAPACITIVE LOAD</b>						
Stable output capacitor range			0		10	$\mu\text{F}$
<b>HYSTERESIS AND LONG TERM STABILITY</b>						
Long-term stability		0 to 1000 hours		60		ppm
Output voltage hysteresis <sup>(4)</sup>		$25^\circ\text{C}$ , $-40^\circ\text{C}$ , $125^\circ\text{C}$ , $25^\circ\text{C}$	Cycle 1	60		ppm
			Cycle 2	35		

(1) Temperature drift is specified according to the box method. See the [Feature Description](#) section for more details.

(2) The  $V_{REF}$  and  $V_{BIAS}$  tracking over temperature specification is explained in more detail in the [Feature Description](#) section.

(3) The peak-to-peak noise measurement procedure is explained in more detail in the [Noise Performance](#) section.

(4) The thermal hysteresis measurement procedure is explained in more detail in the [Thermal Hysteresis](#) section.

## 7.6 Typical Characteristics

At  $T_A = 25^\circ\text{C}$ ,  $I_L = 0\text{ mA}$ ,  $V_{IN} = 5\text{-V}$  power supply,  $C_L = 0\text{ }\mu\text{F}$ , and 2.5-V output, unless otherwise noted.

## 8 Parameter Measurement Information

### 8.1 Solder Heat Shift

The materials used in the manufacture of the REF20xx have differing coefficients of thermal expansion, resulting in stress on the device die when the part is heated. Mechanical and thermal stress on the device die can cause the output voltages to shift, degrading the initial accuracy specifications of the product. Reflow soldering is a common cause of this error.

In order to illustrate this effect, a total of 92 devices were soldered on four printed circuit boards [23 devices on each printed circuit board (PCB)] using lead-free solder paste and the paste manufacturer suggested reflow profile. The reflow profile is as shown in [Figure 40](#). The printed circuit board is comprised of FR4 material. The board thickness is 1.57 mm and the area is 171.54 mm × 165.1 mm.

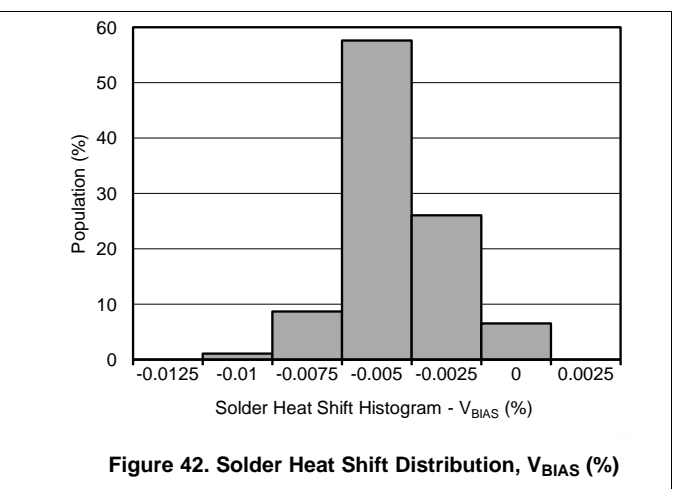

The reference and bias output voltages are measured before and after the reflow process; the typical shift is displayed in [Figure 41](#) and [Figure 42](#). Although all tested units exhibit very low shifts (< 0.01%), higher shifts are also possible depending on the size, thickness, and material of the printed circuit board. An important note is that the histograms display the typical shift for exposure to a single reflow profile. Exposure to multiple reflows, as is common on PCBs with surface-mount components on both sides, causes additional shifts in the output bias voltage. If the PCB is exposed to multiple reflows, the device should be soldered in the second pass to minimize its exposure to thermal stress.

**Figure 40. Reflow Profile**

**Figure 41. Solder Heat Shift Distribution, V<sub>REF</sub> (%)**

**Figure 42. Solder Heat Shift Distribution, V<sub>BIAS</sub> (%)**

## 8.2 Thermal Hysteresis

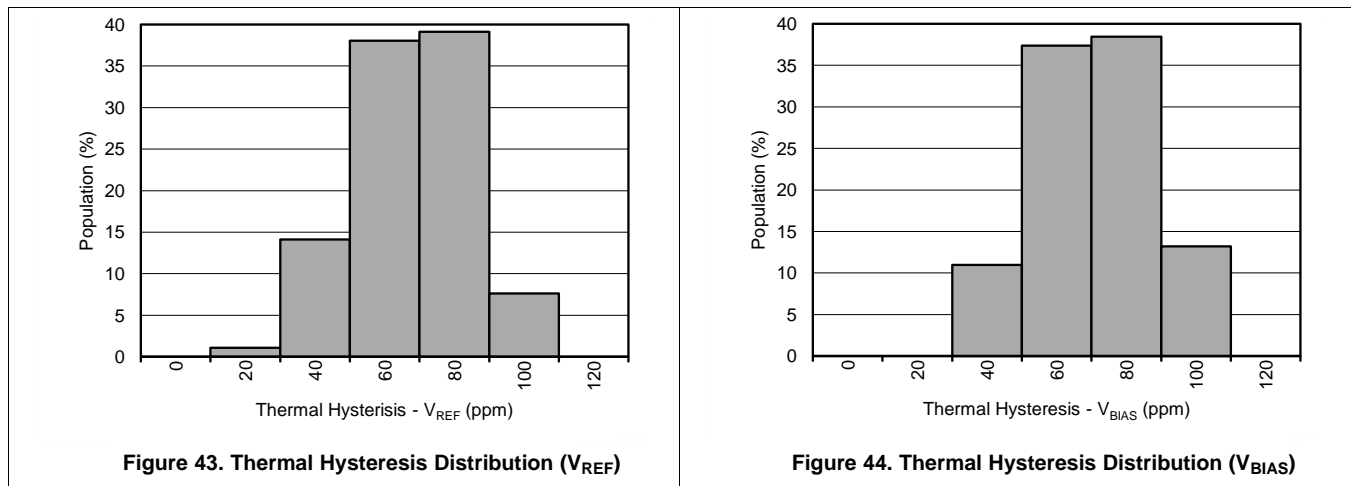

Thermal hysteresis is measured with the REF20xx soldered to a PCB, similar to a real-world application. Thermal hysteresis for the device is defined as the change in output voltage after operating the device at 25°C, cycling the device through the specified temperature range, and returning to 25°C. Hysteresis can be expressed by Equation 1:

$$V_{\text{HYST}} = \left( \frac{|V_{\text{PRE}} - V_{\text{POST}}|}{V_{\text{NOM}}} \right) \cdot 10^6 \text{ (ppm)}$$

where

- $V_{\text{HYST}}$  = thermal hysteresis (in units of ppm),
  - $V_{\text{NOM}}$  = the specified output voltage,
  - $V_{\text{PRE}}$  = output voltage measured at 25°C pre-temperature cycling, and
  - $V_{\text{POST}}$  = output voltage measured after the device has cycled from 25°C through the specified temperature range of –40°C to 125°C and returns to 25°C.
- (1)

Typical thermal hysteresis distribution is as shown in Figure 43 and Figure 44.

### 8.3 Noise Performance

Typical 0.1-Hz to 10-Hz voltage noise can be seen in [Figure 45](#) and [Figure 46](#). Device noise increases with output voltage and operating temperature. Additional filtering can be used to improve output noise levels, although care should be taken to ensure the output impedance does not degrade ac performance. Peak-to-peak noise measurement setup is shown in [Figure 47](#).

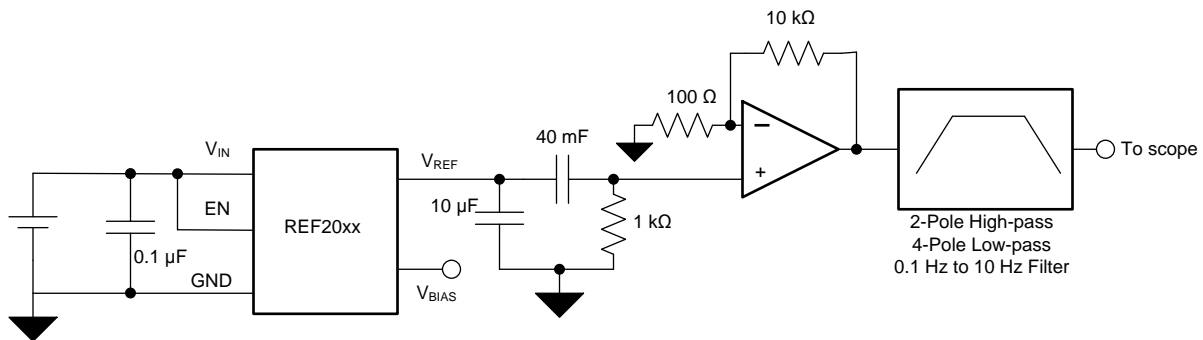

Figure 47. 0.1-Hz to 10-Hz Noise Measurement Setup

## 9 Detailed Description

### 9.1 Overview

The REF20xx are a family of dual-output,  $V_{REF}$  and  $V_{BIAS}$  ( $V_{REF} / 2$ ) band-gap voltage references. The [Functional Block Diagram](#) section provides a block diagram of the basic band-gap topology and the two buffers used to derive the  $V_{REF}$  and  $V_{BIAS}$  outputs. Transistors  $Q_1$  and  $Q_2$  are biased such that the current density of  $Q_1$  is greater than that of  $Q_2$ . The difference of the two base emitter voltages ( $V_{BE1} - V_{BE2}$ ) has a positive temperature coefficient and is forced across resistor  $R_5$ . The voltage is amplified and added to the base emitter voltage of  $Q_2$ , which has a negative temperature coefficient. The resulting band-gap output voltage is almost independent of temperature. Two independent buffers are used to generate  $V_{REF}$  and  $V_{BIAS}$  from the band-gap voltage. The resistors  $R_1$ ,  $R_2$  and  $R_3$ ,  $R_4$  are sized such that  $V_{BIAS} = V_{REF} / 2$ .

e-Trim™ is a method of package-level trim for the initial accuracy and temperature coefficient of  $V_{REF}$  and  $V_{BIAS}$ , implemented during the final steps of manufacturing after the plastic molding process. This method minimizes the influence of inherent transistor mismatch, as well as errors induced during package molding. e-Trim is implemented in the REF20xx to minimize the temperature drift and maximize the initial accuracy of both the  $V_{REF}$  and  $V_{BIAS}$  outputs.

### 9.2 Functional Block Diagram

### 9.3 Feature Description

#### 9.3.1 $V_{REF}$ and $V_{BIAS}$ Tracking

Most single-supply systems require an additional stable voltage in the middle of the analog-to-digital converter (ADC) input range to bias input bipolar signals. The  $V_{REF}$  and  $V_{BIAS}$  outputs of the REF20xx are generated from the same band-gap voltage as shown in the [Functional Block Diagram](#) section. Hence, both outputs track each other over the full temperature range of  $-40^{\circ}\text{C}$  to  $125^{\circ}\text{C}$  with an accuracy of 7 ppm/ $^{\circ}\text{C}$  (max). The tracking accuracy increases to 6 ppm/ $^{\circ}\text{C}$  (max) when the temperature range is limited to  $-40^{\circ}\text{C}$  to  $85^{\circ}\text{C}$ . The tracking error is calculated using the box method, as described by [Equation 2](#):

$$\text{Tracking Error} = \left( \frac{V_{\text{DIFF(MAX)}} - V_{\text{DIFF(MIN)}}}{V_{\text{REF}} \cdot \text{Temperature Range}} \right) \cdot 10^6 \quad (\text{ppm})$$

where

$$\bullet \quad V_{\text{DIFF}} = V_{\text{REF}} - 2 \cdot V_{\text{BIAS}} \quad (2)$$

## Feature Description (continued)

The tracking accuracy is as shown in Figure 48.

Figure 48. V<sub>REF</sub> and V<sub>BIAS</sub> Tracking vs Temperature

### 9.3.2 Low Temperature Drift

The REF20xx is designed for minimal drift error, which is defined as the change in output voltage over temperature. The drift is calculated using the box method, as described by Equation 3:

$$\text{Drift} = \left( \frac{V_{\text{REF(MAX)}} - V_{\text{REF(MIN)}}}{V_{\text{REF}} \cdot \text{Temperature Range}} \right) \cdot 10^6 \quad (\text{ppm}) \quad (3)$$

### 9.3.3 Load Current

The REF20xx family is specified to deliver a current load of  $\pm 20$  mA per output. Both the V<sub>REF</sub> and V<sub>BIAS</sub> outputs of the device are protected from short circuits by limiting the output short-circuit current to 50 mA. The device temperature increases according to Equation 4:

$$T_J = T_A + P_D \cdot R_{\theta JA}$$

where

- T<sub>J</sub> = junction temperature (°C),
  - T<sub>A</sub> = ambient temperature (°C),
  - P<sub>D</sub> = power dissipated (W), and
  - R<sub>θJA</sub> = junction-to-ambient thermal resistance (°C/W)
- (4)

The REF20xx maximum junction temperature must not exceed the absolute maximum rating of 150°C.

## 9.4 Device Functional Modes

When the EN pin of the REF20xx is pulled high, the device is in active mode. The device should be in active mode for normal operation. The REF20xx can be placed in a low-power mode by pulling the ENABLE pin low. When in shutdown mode, the output of the device becomes high impedance and the quiescent current of the device reduces to 5 μA in shutdown mode. See the [Electrical Characteristics](#) for logic high and logic low voltage levels.

## 10 Applications and Implementation

---

### NOTE

Information in the following applications sections is not part of the TI component specification, and TI does not warrant its accuracy or completeness. TI's customers are responsible for determining suitability of components for their purposes. Customers should validate and test their design implementation to confirm system functionality.

---

### 10.1 Application Information

The low-drift, bidirectional, single-supply, low-side, current-sensing solution, described in this section, can accurately detect load currents from  $-2.5\text{ A}$  to  $2.5\text{ A}$ . The linear range of the output is from  $250\text{ mV}$  to  $2.75\text{ V}$ . Positive current is represented by output voltages from  $1.5\text{ V}$  to  $2.75\text{ V}$ , whereas negative current is represented by output voltages from  $250\text{ mV}$  to  $1.5\text{ V}$ . The difference amplifier is the [INA213](#) current-shunt monitor, whose supply and reference voltages are supplied by the low-drift REF2030.

Industrial applications with electronics in corrosive environments are susceptible to corrosive damage due to the exposure to heat, moisture, and corrosive gases. The combination of the following conditions in a given system lead to higher risk of corrosive damage:

1. Ventilated enclosures exposing underlying PCB.
2. PCBs not conformally coated.
3. Exposed-lead components with plating susceptible to corrosion.
4. Changes in plating techniques for RoHS compliance (e.g. removal of Pb (lead) and certain types of plating).

To improve resistance to corrosion in harsh environments, the REF2025AISDDCR uses Matte-Sn plating with improved assembly process to reduce exposed Cu, leading to improved corrosion resistance in the Battelle Class III and similar harsh environments. The "S" in the part number identifies this special plating option. REF2025 versions that do not have the "S" will continue to be available in industry standard NiPdAu processing technique.

## 10.2 Typical Application

### 10.2.1 Low-Side, Current-Sensing Application

Figure 49. Low-Side, Current-Sensing Application

## Typical Application (continued)

### 10.2.1.1 Design Requirements

The design requirements are as follows:

1. Supply voltage: 5.0 V
2. Load current:  $\pm 2.5$  A
3. Output: 250 mV to 2.75 V
4. Maximum shunt voltage:  $\pm 25$  mV

### 10.2.1.2 Detailed Design Procedure

Low-side current sensing is desirable because the common-mode voltage is near ground. Therefore, the current-sensing solution is independent of the bus voltage,  $V_{BUS}$ . When sensing bidirectional currents, use a differential amplifier with a reference pin. This procedure allows for the differentiation between positive and negative currents by biasing the output stage such that it can respond to negative input voltages. There are a variety of methods for supplying power ( $V+$ ) and the reference voltage ( $V_{REF}$ , or  $V_{BIAS}$ ) to the differential amplifier. For a low-drift solution, use a monolithic reference that supplies both power and the reference voltage. [Figure 50](#) shows the general circuit topology for a low-drift, low-side, bidirectional, current-sensing solution. This topology is particularly useful when interfacing with an ADC; see [Figure 49](#). Not only do  $V_{REF}$  and  $V_{BIAS}$  track over temperature, but their matching is much better than alternate topologies. For a more detailed version of the design procedure, refer to [TIDU357](#).

**Figure 50. Low-Drift, Low-side, Bidirectional, Current-Sensing Circuit Topology**

The transfer function for the circuit given in [Figure 50](#) is as shown in [Equation 5](#):

$$\begin{aligned}
 V_{OUT} &= G \cdot (\pm V_{SHUNT}) + V_{BIAS} \\
 &= G \cdot (\pm I_{LOAD} \cdot R_{SHUNT}) + V_{BIAS}
 \end{aligned}
 \tag{5}$$

## Typical Application (continued)

### 10.2.1.2.1 Shunt Resistor

As illustrated in [Figure 50](#), the value of  $V_{SHUNT}$  is the ground potential for the system load. If the value of  $V_{SHUNT}$  is too large, issues may arise when interfacing with systems whose ground potential is actually 0 V. Also, a value of  $V_{SHUNT}$  that is too negative may violate the input common-mode voltage of the differential amplifier in addition to potential interfacing issues. Therefore, limiting the voltage across the shunt resistor is important. [Equation 6](#) can be used to calculate the maximum value of  $R_{SHUNT}$ .

$$R_{SHUNT(max)} = \frac{V_{SHUNT(max)}}{I_{LOAD(max)}} \quad (6)$$

Given that the maximum shunt voltage is  $\pm 25$  mV and the load current range is  $\pm 2.5$  A, the maximum shunt resistance is calculated as shown in [Equation 7](#).

$$R_{SHUNT(max)} = \frac{V_{SHUNT(max)}}{I_{LOAD(max)}} = \frac{25mV}{2.5A} = 10m\Omega \quad (7)$$

To minimize errors over temperature, select a low-drift shunt resistor. To minimize offset error, select a shunt resistor with the lowest tolerance. For this design, the Y14870R01000B9W resistor is used.

### 10.2.1.2.2 Differential Amplifier

The differential amplifier used for this design should have the following features:

1. Single-supply (3 V),
2. Reference voltage input,
3. Low initial input offset voltage ( $V_{OS}$ ),
4. Low-drift,
5. Fixed gain, and
6. Low-side sensing (input common-mode range below ground).

For this design, a current-shunt monitor (INA213) is used. The INA21x family topology is shown in [Figure 51](#). The INA213B specifications can be found in the [INA213 product data sheet](#).

Copyright © 2017, Texas Instruments Incorporated

**Figure 51. INA21x Current-Shunt Monitor Topology**

### Typical Application (continued)

The INA213B is an excellent choice for this application because all the required features are included. In general, instrumentation amplifiers (INAs) do not have the input common-mode swing to ground that is essential for this application. In addition, INAs require external resistors to set their gain, which is not desirable for low-drift applications. Difference amplifiers typically have larger input bias currents, which reduce solution accuracy at small load currents. Difference amplifiers typically have a gain of 1 V/V. When the gain is adjustable, these amplifiers use external resistors that are not conducive to low-drift applications.

#### 10.2.1.2.3 Voltage Reference

The voltage reference for this application should have the following features:

1. Dual output (3.0 V and 1.5 V),
2. Low drift, and
3. Low tracking errors between the two outputs.

For this design, the REF2030 is used. The REF20xx topology is as shown in the [Functional Block Diagram](#) section.

The REF2030 is an excellent choice for this application because of its dual output. The temperature drift of 8 ppm/°C and initial accuracy of 0.05% make the errors resulting from the voltage reference minimal in this application. In addition, there is minimal mismatch between the two outputs and both outputs track very well across temperature, as shown in [Figure 52](#) and [Figure 53](#).

#### 10.2.1.2.4 Results

Table 1 summarizes the measured results.

**Table 1. Measured Results**

ERROR	UNCALIBRATED (%)	CALIBRATED (%)
Error across the full load current range (25°C)	±0.0355	±0.004
Error across the full load current range (-40°C to 125°C)	±0.0522	±0.0606

**10.2.1.3 Application Curves**

Performing a two-point calibration at 25°C removes the errors associated with offset voltage, gain error, and so forth. [Figure 54](#) to [Figure 56](#) show the measured error at different conditions. For a more detailed description on measurement procedure, calibration, and calculations, please refer to [TIDU357](#).

## 11 Power-Supply Recommendations

The REF20xx family of references feature an extremely low-dropout voltage. These references can be operated with a supply of only 20 mV above the output voltage. For loaded reference conditions, a typical dropout voltage versus load is shown in Figure 57. A supply bypass capacitor ranging between 0.1  $\mu\text{F}$  to 10  $\mu\text{F}$  is recommended.

**Figure 57. Dropout Voltage vs Load Current**

## 13 Device and Documentation Support

### 13.1 Documentation Support

#### 13.1.1 Related Documentation

For related documentation see the following:

- [INA21x Voltage Output, Low- or High-Side Measurement, Bidirectional, Zero-Drift Series, Current-Shunt Monitors](#) (SBOS437)
- [Low-Drift Bidirectional Single-Supply Low-Side Current Sensing Reference Design](#) (TIDU357)

### 13.2 Related Links

The table below lists quick access links. Categories include technical documents, support and community resources, tools and software, and quick access to sample or buy.

**Table 2. Related Links**

### 13.3 Receiving Notification of Documentation Updates

To receive notification of documentation updates, navigate to the device product folder on ti.com. In the upper right corner, click on *Alert me* to register and receive a weekly digest of any product information that has changed. For change details, review the revision history included in any revised document.

### 13.4 Community Resources

The following links connect to TI community resources. Linked contents are provided "AS IS" by the respective contributors. They do not constitute TI specifications and do not necessarily reflect TI's views; see TI's [Terms of Use](#).

**TI E2E™ Online Community** *TI's Engineer-to-Engineer (E2E) Community*. Created to foster collaboration among engineers. At e2e.ti.com, you can ask questions, share knowledge, explore ideas and help solve problems with fellow engineers.

**Design Support** *TI's Design Support* Quickly find helpful E2E forums along with design support tools and contact information for technical support.

### 13.5 Trademarks

E2E is a trademark of Texas Instruments.

e-Trim is a trademark of Texas Instruments, Inc.

All other trademarks are the property of their respective owners.

### 13.6 Electrostatic Discharge Caution

This integrated circuit can be damaged by ESD. Texas Instruments recommends that all integrated circuits be handled with appropriate precautions. Failure to observe proper handling and installation procedures can cause damage.

ESD damage can range from subtle performance degradation to complete device failure. Precision integrated circuits may be more susceptible to damage because very small parametric changes could cause the device not to meet its published specifications.

### 13.7 Glossary

**SLYZ022** — *TI Glossary*.

This glossary lists and explains terms, acronyms, and definitions.

## 14 Mechanical, Packaging, and Orderable Information

The following pages include mechanical packaging and orderable information. This information is the most current data available for the designated devices. This data is subject to change without notice and revision of this document. For browser-based versions of this data sheet, refer to the left-hand navigation.

## PACKAGING INFORMATION

(1) The marketing status values are defined as follows:

**ACTIVE:** Product device recommended for new designs.

**LIFEBUY:** TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

**NRND:** Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

**PREVIEW:** Device has been announced but is not in production. Samples may or may not be available.

**OBSOLETE:** TI has discontinued the production of the device.

(2) **RoHS:** TI defines "RoHS" to mean semiconductor products that are compliant with the current EU RoHS requirements for all 10 RoHS substances, including the requirement that RoHS substance do not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, "RoHS" products are suitable for use in specified lead-free processes. TI may reference these types of products as "Pb-Free".

**RoHS Exempt:** TI defines "RoHS Exempt" to mean products that contain lead but are compliant with EU RoHS pursuant to a specific EU RoHS exemption.

**Green:** TI defines "Green" to mean the content of Chlorine (Cl) and Bromine (Br) based flame retardants meet JS709B low halogen requirements of <=1000ppm threshold. Antimony trioxide based flame retardants must also meet the <=1000ppm threshold requirement.

(3) MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

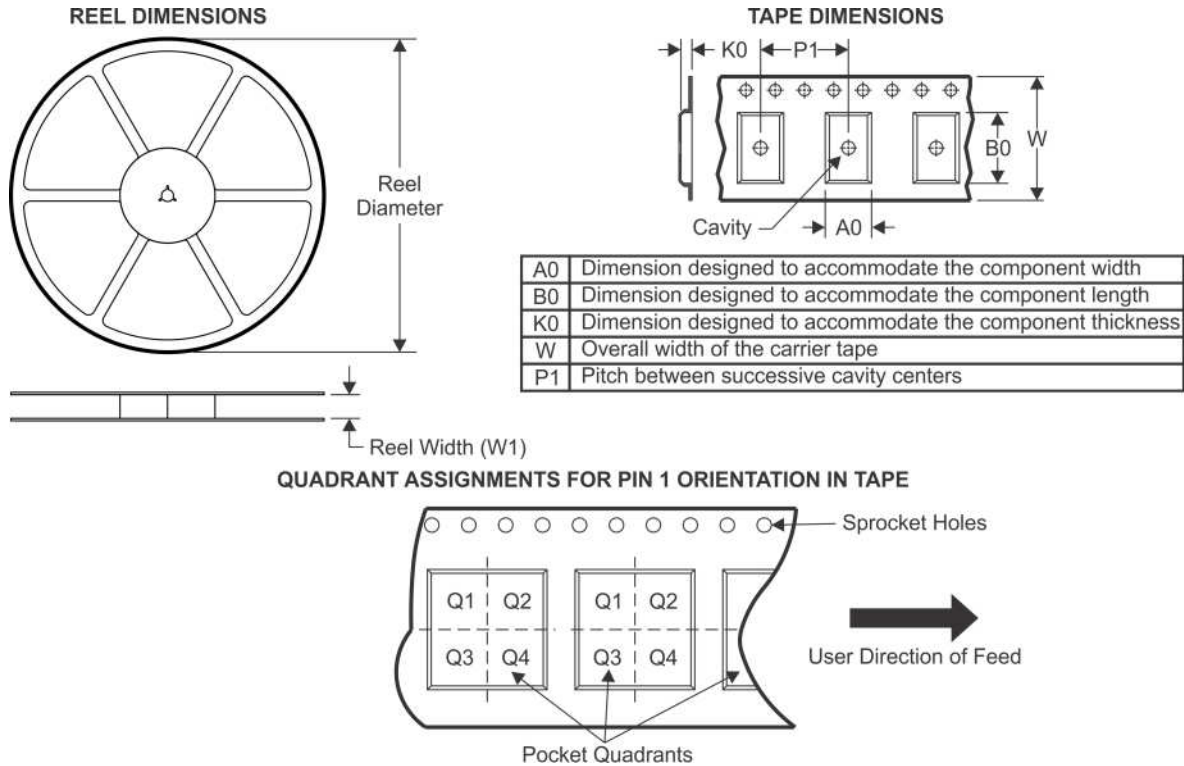

(4) There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

(5) Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "~" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

(6) Lead/Ball Finish - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead/Ball Finish values may wrap to two lines if the finish value exceeds the maximum column width.

**Important Information and Disclaimer:**The information provided on this page represents TI's knowledge and belief as of the date that it is provided. TI bases its knowledge and belief on information provided by third parties, and makes no representation or warranty as to the accuracy of such information. Efforts are underway to better integrate information from third parties. TI has taken and continues to take reasonable steps to provide representative and accurate information but may not have conducted destructive testing or chemical analysis on incoming materials and chemicals. TI and TI suppliers consider certain information to be proprietary, and thus CAS numbers and other limited information may not be available for release.

In no event shall TI's liability arising out of such information exceed the total purchase price of the TI part(s) at issue in this document sold by TI to Customer on an annual basis.
